B6R: Three-way valve with inside thread (nominal pressure 16 bar)

For continuous control of warm and cold water or of air. Valve body of bronze (RG 5). Valve seat of bronze; spindle of stainless steel; plug of either stainless steel or brass; metallic sealing. Stuffing box of brass with O-ring seal. Valve curve is either equal percentage or linear. When spindle is extracted, passage A-AB is closed.

Complete type designation: Valve and drive each with F-variant

Valve: F-variant, technical data and accessories, see valve type table

Drive: F-variant, technical data, accessories and fitting position, see Sect. 71

B6R 15 F300 / AVP142 F001 Example:

 $\Delta p_{max}[bar]$ = Max. permissible pressure difference across the valve at which the drive can still

safely open and close the valve.

Max. permissible pressure difference across the valve during malfunction at which Δp_s

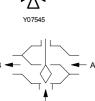

the drive can close the valve.

[bar]= Dormant press. at valve when pump is inactive. Takes into account the fluidic level of the p_{stat}

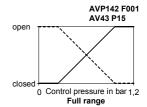

plant and the press. increase caused by the press. tank or the steam press.

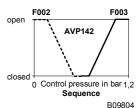

- 1) At temperatures under 0 °C, use stuffing-box heating (accessory)
- 2) Based on the Centair air capacity (400 I_n/h) and a line of 20 m in length and 4 mm in diameter
- 3) When used with an XSP 31 or 31 G positioner, the Δp_{max} values are seven times bigger; observe the Δp_v value (see additional technical details).

Pressure-stroke curve

As delivered ex works Fitting variant A

Operation

Using a pneumatic drive, the valve can be moved to any position. When the spindle is extracted, control passage A-AB is closed. Where pneumatic drives are used, the valves should not close with the pressure, otherwise pressure surges ensue.

Used as a mixing valve

Engineering and fitting notes

Can be fitted in any position except facing downwards.

The ingress of condensate, dripping water etc., along the stem and into the drive should be prevented. When fitting the drive to the valve, care must be taken not to turn the valve plug on the two stops (seat), thus damaging the seal.

The drive can be equipped with the XSP 31 or XSP 31G positioner should any of the following be demanded: a split range; an improvement in the setting accuracy; an increase in positional speed or air capacity; reversible direction of action (see Section 79).

 Δp_v in bar = max. pressure difference across the valve in any stroke position, limited by the noise level and erosion (max. values without being limited by the force of the drive).

Additional details on accessories

0217268/ . . . Heating for stuffing box 15 W; housing of light metal; connecting cable 3×0.75 mm², earth connection, 1 m in length, cable end sleeves; degree of protection IP 54.

Additional details on model types

Valve body with female thread. Flat seal of copper at the body. Stuffing box with O-ring of ethylenepropylene.

Explanation of terms used

Δp_{v} :

Maximum permissible pressure difference across the valve in any stroke position, limited by the noise level and erosion.

The valve as a traversed element is defined by this parameter specifically in its hydraulic behaviour. By monitoring cavitation, erosion and the noise thus produced, improvements can be achieved in both life expectancy and durability.

Δp_{max} :

Maximum permissible pressure difference across the valve at which the drive can firmly open and close the valve.

Static pressure and fluidic influences are taken into account. This value helps to maintain smooth stroke action and valve sealing. In doing so, the valve's Δp_{ν} value is not exceeded.

Maximum permissible pressure difference across the valve in the event of a malfunction (e.g. power failure) at which the drive can firmly close the valve and, if necessary, hold the full operating pressure against atmospheric pressure. Since this is a safety function with `fast' stroke, Δp_s can be larger than Δp_{max} or, respectively, Δp_{v} . The resultant fluidic disturbances are soon overcome and play a minor rôle here.

On the three-way valves, the values apply only for the control passage.

Pneumatic manipulating units, General information

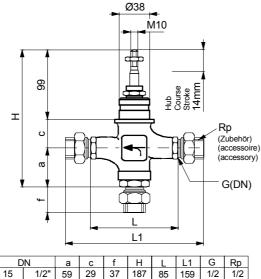

Line pressure behind the valve. This corresponds largely to the dead pressure when the pump is switched off, e.g. due to the level of liquid in the plant, an increase in pressure via the pressure store, steam pressure etc.

Where the valves close with the pressure, the static pressure plus the pump pressure should be used.
